

Dear Vikas Tanwar,

When I saw the Integration Engineer role at DI SOLAR, it caught my attention not just because it matches my background in engineering and backend development, but because I genuinely enjoy the puzzle of making different systems talk to each other reliably.

My professional path has been a mix of hardware and software. While my degree is in Electronic Engineering, my programming experience spans from building embedded firmware and low-level communication protocols to developing robust backend architectures with Python and Django. Throughout my recent projects, including designing scalable systems and optimizing data flows, I have learned how crucial clear API design and rigorous troubleshooting are for keeping complex environments running smoothly. Working independently comes naturally to me, and I take pride in writing clean, well-documented code that prevents integration headaches down the road.

I am currently based in Melbourne on a Working Holiday Visa and am eager to bring my analytical mindset and technical adaptability to your remote team. I would love the chance to discuss how my background can support DI SOLAR's technical goals.

Sincerely,

Javier Nicolas Nieto
