

Dear Hiring Team,

As an electronic engineer currently living in Melbourne on a Working Holiday Visa, I was genuinely excited to find your opening. My background sits right at the intersection of low-level C and C++ programming, hardware architecture, and performance optimisation, which is why your work in high-performance computing immediately caught my attention. While my formal training is in electronics, my day-to-day reality has always involved writing clean code, squeezing every drop of performance out of microcontrollers and processing units, and diving deep into memory management and complex data flows.

Over recent years, I have built everything from custom firmware for satellite communication models using LoRa and I2C, to developing AI-integrated robotic systems and handling robust backend architectures. I really enjoy the puzzle of low-level software development—figuring out when it is worth optimising down to the metal and when to keep things straightforward. Working with mixed environments of C, C++, and Python is something I do naturally, and I am very comfortable having technical conversations about threading, concurrency, and efficient resource handling.

I am already based in Melbourne with full working rights, so I can start right away and seamlessly integrate into your team. I wanted to make sure I followed every instruction closely, including the inclusion of Shibboleth, to demonstrate my attention to detail. I would love the chance to chat in person about how my hands-on technical background can bring value to your scientific software and high-performance computing projects.

Sincerely,

Javier Nicolas Nieto
