

Dear Hiring Team,

What excites me most about robotics is the moment code transitions into physical movement and solves a tangible problem in the real world. When I led the development of an AI-driven humanoid robot based on the InMoov project, my focus was never just theoretical. I spent my time getting my hands dirty designing custom PCBs, integrating computer vision, and making sure the software actually worked smoothly with the hardware.

My background as an electronic engineer spans everything from embedded firmware and microcontroller architectures to Python and C++ programming. During my final engineering project, I engineered a functional CubeSat payload model utilizing LoRa and I2C protocols, and earlier I built a hexapod search and rescue robot. Because I am currently based in Melbourne on a Working Holiday Visa with full working rights, I am ready to dive straight into hands-on robot testing, custom software integration, and field deployments.

I thrive in fast-moving environments where you have to read unfamiliar SDK documentation, tackle unexpected hardware glitches, and figure things out on the fly. I would love the chance to bring this practical mindset to your team and help shape the future of commercial robotics in Australia.

Sincerely,

Javier Nicolas Nieto
